An effective tool for use in large or small boom deployments

- Replaces a tow boat, minimising costs
- Modular approach for ultimate flexibility
- Lightweight and easy to deploy
- Suit towing speeds up to 4.5 knots

Our paravane is a valuable addition to a response package for deploying booms or our advancing skimmers such as Fasflo.

A paravane is often referred to as a water kite. It is attached to the boom and powered by the water to slow and steady the boom replacing a tow boat.

The Vikoma paravane is a powerful and versatile tool. In a traditional open water boom deployment it replaces the tow boat, enabling a single vessel to deploy a boom system

Our paravane is a unique modular design offering ultimate flexibility with three sizes available to suit boom or Fasflo size. We offer interchangeable options for conversion allowing Paravane Maxi to be converted to a Midi and Paravane Midi to be converted to a Maxi. This gives you a really cost effective and flexible tool to easily convert to the size you need at the time of a spill.

Paravane Maxi has a twin vane arrangement and is ideally suited to medium to large boom systems in open water.

Paravane Midi has a single vane arrangement and is suited to small to medium boom systems in rivers and sheltered waters.

In a river deployment Paravane Mini can be used alongside personnel to manually deploy a boom system without the need for a boat. This functionality minimises personnel and reduces costs making it ideally suited to training exercises as well as oil spill response.

Product benefits:

- Replaces tow boat
- Lightweight Aluminium for easy handling
- Unique arrangement to convert between two sizes
- Reduces costs and personnel for a deployment
- Environmentally friendly solution
