The Mini-Vac system is a lightweight, hand portable vacuum recovery system for the collection of spilt oils and floating contaminants at a recovery rate of 24m³/hr.

The modular design of the Mini-Vac means it can be lifted by two people which makes it ideal for use in remote and inaccessible sites such as rocky beaches, around ponds & lakes, marshland, harbours and industrial pits. It is also ideal for cleaning spills on land and hard surfaces as well as oil recovery from ice.

The modular system is available in three standard formats:

Mini-Vac Basic - a complete operational system comprising Mini-Vac, vacuum head, hoses and suction lance.

Mini-Vac Plus - an enhanced system, including all the Mini-Vac basic equipment with an additional Mini-pump unit to enable the continuous recovery of oil which is then transferred to collection drums or tanks located further up the beach for easier transportation. The Mini-pump can also be used as a separate pumping system for other duties.

Mini-Vac Plus Containerised - a custom built container housing all Mini-Vac Plus components.

The Mini-Vac system can also be used with Vikoma Delta skimmer head as an attachment to give greater flexibility and recovery options.
